

BIRD WATCHING ROUTES IN THE GAUJA NATIONAL PARK

Discover the Gauja National Park and its wildlife wealth - picturesque forest paths, fast rivers and impressive rocks. Especially for bird lovers, enjoy bird watching routes!

Bird diversity and rare species

Gauja National Park preserves the rich nature of the old Gauja river valley and its surroundings, a large variety of plants, birds and insects. More than 800 plant species, 149 bird and 48 mammal species are found here.

Tourists who are interested in nature especially appreciate the variety of birds in the park, because here you can see birds that are rarely found in Western Europe, hear their voices, and get to know their natural habitats. For example, one such example is the mountain keel. Although there are only a few pairs here, this is the best and safest place in Latvia to observe these birds during the migration period.

Shore reservoir

Slopes covered with old deciduous forests attract rarer species of woodpeckers - white-backed, three-toed and medium spotted woodpeckers, black woodpeckers. In Gaujas park, jerusalems, little flycatchers, northern plovers are

frequent, and the smallest of the species living in Latvia, the sparrow owl, is also observed more and more often, and the Ural owl has recently started breeding.

In addition to forest birds, species of sparrow birds uncommon in Western Europe can be found on the shores of rivers and lakes, such as the river warbler and the garden reed, the shorebirds live, and in the meadows you can still hear squeals.

During the migration period, the birds stop at disused or operating gravel quarries (Lode, Bāle, Cēsis) and the largest park, Lake Ungur, and the meadows bordering the Suda marsh and outside the reserve area become important gathering places for cranes in autumn.

Important habitats for birds are the alleys and parks of former manor houses, which attract many common and easily noticeable birds - woodpeckers, house owls, flycatchers, red-tailed grebes, and plovers.

Observation points in Gauja National Park

Interesting places for bird watching near the Gauja National Park are the forests of Zilaiskalns and its slopes or the forests near the Siet rock (Sietiņezis), where you can see jerubas, little flycatchers, various species of woodpeckers, including the rare three-toed woodpecker.

From a natural point of view, special places are also the Didžioji (Lielais) and Pemma (bird species living in the marshes) marshes in the north of Straupē, as well as the largest lake in the park, Lake Ungur.

And in the most popular place visited by tourists - the Turaida Museum-Reserve, while swimming in the river, you can easily see white-backed woodpeckers and gray mallots in the old coastal trees, listen to their trills in the spring, and at the same time watch diving galls.

Gauja National Park and its surrounding areas are popular with white storks. More than 120 pairs of them breed here, and the forests also shelter several pairs of black storks.

Gray cranes
